## Force Net Hard

Step 1: Draw in your three forces in the picture below. Also write down the magnitude and direction of each force.

Step 2: Find the components of each of your three forces

Force 1
$180^{\circ} \longleftrightarrow 0^{\circ}$

Force 2

Force 3

Step 3: Combine all your x-components of your forces together to get a net force x and then do the same to get a net force $y$. Show your work below.

Step 4: Using your components, find the actual net force and its angle with respect to the $0^{\circ}$ line. Your final angle should be between $0^{\circ}$ and $360^{\circ}$. Enter this into the program to see if you did everything correctly
